

**ORGANIZATION OF THE
PHARMACY'S WORK ON RECEIVING
PRESCRIPTIONS AND DISPENSING
MEDICINES CONTAINING POTENT
AND TOXIC SUBSTANCES**

Potent substances are substances that are dangerous to health and life when taken in large doses and when there are medical contraindications to their use. Such substances can cause a state of dependence, have a stimulating or depressive effect on the central nervous system, cause hallucinations or disorders of motor function, thinking, behavior, perception, mood or may lead to similar harmful effects.

The lists of potent and poisonous substances are based on

- peculiarities of the pharmacological action of the substances,
- Data from the practice of judicial and investigative authorities related to unlawful actions with these substances.

The lists include not only medicines, but also other substances not permitted for use in medical practice. The lists cover a wide range of synthetic and natural substances. The lists are relevant to the prevention of illegal distribution of potentially dangerous addictive compounds. They are important for medical and pharmaceutical professionals, as well as for law enforcement officers.

Nomenclature of drugs containing potent, poisonous substances

The list of potent substances includes, for example:

-

Barbituric acid derivatives.

- Hexobarbital
- Methyltestosterone
- Clopheline
