

Control question and literature to the Topic 3 “Disorders of chromo proteins metabolism (exogenous and endogenous pigments). Hemosiderosis and hemochromatosis. Jaundice. Disorders of nucleic acids metabolism. Pathological calcification. Formation of stones.”

on pathological anatomy (3rd semester)

Control question:

1. Disturbance of the exchange of hemoglobinogenic pigments. Hemosiderosis, hemochromatosis, hemomelanosis, jaundice (hemolytic, obstructive and hepatic), porphyria: causes, pathogenesis, morphological characteristics, outcomes, functional significance.
2. Disturbance of the exchange of proteinogenic pigments. Hypomelanosis and hypermelanosis (general and local, acquired and hereditary): examples, causes, pathogenesis, morphological characteristics, outcomes, functional significance.
3. Disturbance of lipidogenic pigment metabolism: causes, pathogenesis, morphological characteristics, outcomes, functional significance.
4. Disturbance of the exchange of nucleoproteins. Gout, urolithiasis, uric acid infarct: causes, pathogenesis, morphological characteristics, outcomes, functional significance.
5. Disturbance of calcium metabolism – calcification (calcinosis, petrification): definition. Types of calcinosis (metastatic, dystrophic and metabolic): causes, pathogenesis, morphological characteristics, outcomes, functional significance. Rickets: causes, pathogenesis, morphological characteristics, outcomes, functional significance. Impact of calcium and phosphorus metabolism on the formation of jaw bones.
6. Stone formation: causes and mechanisms. Types of stones. Stones of salivary ducts. Complications of stone formation.
