Fill in the blanks to summarize lecture content.

| A pure monopoly exists when there is a single seller of a product or service for which |
|--|
| there are (1) (close, no close) substitutes. The monopolist controls the market |
| price by restricting output and preventing entry into the industry. Barriers to entry include |
| government franchises and licenses, patents and copyrights, (2) (control of |
| an important resource, government influence), and economies of scale made possible by large |
| size. Some monopolies that exist because of economies of scale are regulated by |
| government so that the economies associated with large-scale production can be passed on to |
| consumers in the form of lower prices than would be possible if the industry were made up of |
| many small firms operating inefficiently small plants. These monopolies are called (3) |
| (natural, pure) monopolies. |
| The monopolist faces (4) (a horizontal, the market) demand curve |
| because it is the only seller in the market. |
| As compared to perfect competition, the monopolist charges a (5) (higher, lower) |
| price by (6) (expanding output above, restricting output below) the level that would |
| prevail in a competitive market. Because of the presence of barriers to entry, the monopolist |
| (7)(cannot, can) earn economic profits in the long run. With perfect competition, |
| economic profits are competed away in the long run due to entry into the competitive industry. |
| Price discrimination is feasible if the firm can control the price, the good produced (8) |
| (is, is not) resalable, and customers can be differentiated according to their |
| willingness and ability to pay. |
| Perfect competition and pure monopoly represent extreme market structures. |
| Virtually all markets fall somewhere in between. Monopolistic competition and |
| oligopoly are two such imperfectly competitive markets. Monopolistic competition is |
| characterized by (a) (9) (few firms, a large number of firms) with small |
| market shares, (b) the production of goods that (10) (are not, are) |
| perfect substitutes, (c) (11) (concern, lack of concern) regarding rivals1 |
| reactions to price and production policy, (d) relative freedom of entry and exit, and (e) |
| (12) (no, significant) opportunity or incentive to collude to limit |
| competition. |

The consumer benefits from the information content in advertisements and the

| variety of products that are produced as firms try to differentiate their products. Bu |
|--|
| prices (13) (may be higher, are always lower) as a result of the produc |
| promotion and differentiation. |
| (14)(Monopolistic competition, Oligopoly) is a market structure with |
| (15)(a few, many) dominant firms having large market shares and producing |
| either standardized or differentiated goods. |

Definitions

| 1 the ability of a firm to influence the price its product by making |
|---|
| more or less of it available to buyers. |
| 2 a constraint that prevents additional sellers from entering a monopoly |
| firm's market. |
| 3 a firm that emerges as a single seller in the market because of cost |
| or technological advantages contributing to low average costs of production. |
| 4 occurs when there is a single seller of a product that has no close |
| substitutes. |
| 5 the practice of selling a certain product of given quality and cost |
| per unit at different prices to different buyers. |
| 6 exists when more than one seller competes for sales with other |
| sellers of competitive products, each of whom has some control over price. |
| 7 exists when many sellers compete to sell a differentiated product |
| in a market in which entry of new sellers is possible. |
| 8 one dominant firm in an industry that sets its price to maximize its |
| own profits, after which other firms follow its lead by setting exactly the same price/ |
